1.0 Introduction:

This document guides the use of the BIM System Group Catalog objects:

System Corplus SN8

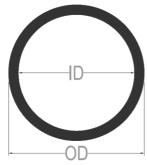

Double layer polyethylene (PE) pipe, corrugated of double PP shell, with internal comoulded surfaces in EPDM, with steinless stell screws and bolts for the mechanical thightening of the connection between the two pipes. The system is conform with the standard EN 13476-3, certified by an accreditated third part certification body according with EN ISO/IEC 17065. The system is produced and tested to guarantee superior performance than the standard request, with a maximum inside pressure of 2 bar for 30 minutes and a maximum outside pressure, 1 bar for 30 minutes. For sewage and drainage applications.

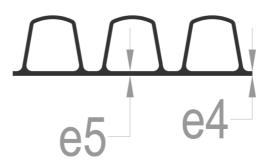

Systema Corplus SN16

Double layer polypropylene (PP) pipe, corrugated outside and smooth inside (type B), the junction is composed of double PP shell, with internal comoulded surfaces in EPDM, with steinless stell screws and bolts for the mechanical thightening of the connection between the two pipes. The system is conform with the standard EN 13476-3, certified by an accreditated third part certification body according with EN ISO/IEC 17065. The system is produced and tested to guarantee superior performance than the standard request, according, with a maximum inside pressure of 2 bar for 30 minutes and a maximum outside pressure, 1 bar for 30 minutes, certified by an accreditated third part certification body according to EN ISO/IEC 17065. For sewage and drainage applications.

1.1 Denominations

The parameters of the BIM objects are named according to the NBS National BIM Library objects standard to identify their type and configuration.

The fields are aggregated using the underscore character (_) and the information within the individual field is separated using the "minus" hyphens (-) characters. Field names are abbreviated to reduce the size and the separations are identified by capital letters to help readability.

The file and object names named as:

File name

Field1Author_Field2 Manufacturer_Field3 Category_Field4 Product Range Object

Field1 Author_ Field2 Manufacturer_Field3 Category_Field4 Class Product_Field5 Variations

2.0 Parameters

The parameters included in the BIM:

3 - Load the IFC (INDUSTRY FOUNDATION CLASS) -BIM object

IFC is a neutral, open, non-proprietary file format and not controlled by a single or group of software producers. The file format is an object oriented parametric developed by BuildingSMART to facilitate interoperability in the field of architecture, engineering and construction. IFC is the collaboration format commonly used in BIM projects. The specification of the IFC model is open and available. In theory, it should allow the exchange and use of relevant data and information between different BIM software.

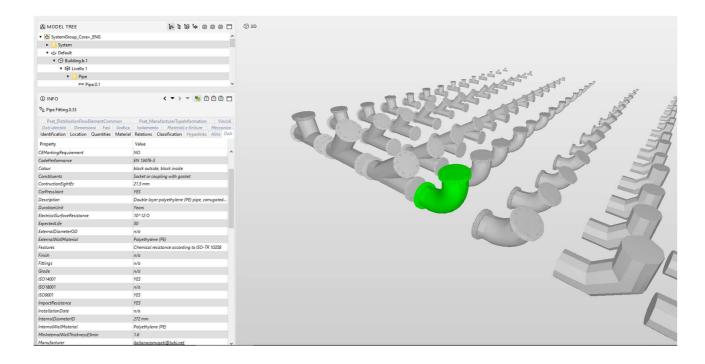

The IFC file is in IFC2x3 format. The new IFC4 scheme is announced soon, but the currently "certified" format is IFC2X3, which is preferred because it allows greater compatibility with the available BIM applications.

In the old versions of Autodesk Revit (example Revit 2013) the export function to the IFC format is done through the use of a specific plugin. IFC is a rapidly developing scheme and new versions of the IFC plugin are often available within the same version of the Revit software. If export is requested in IFC format, we recommend updating the IFC plugin to the latest version.

see http://apps.exchange.autodesk.com/RVT/en/Home/Index

Please note that System Group assumes no responsibility for the supply of IFC and RVT files, its accuracy, reliability and accuracy, nor for any damages, losses, lost profits, etc. as a result of its use.

For information on the IFC Industry Foundation Class, visit the buildingSMART site information page at http://www.buildingsmart-tech.org/specifications/ifc-overview

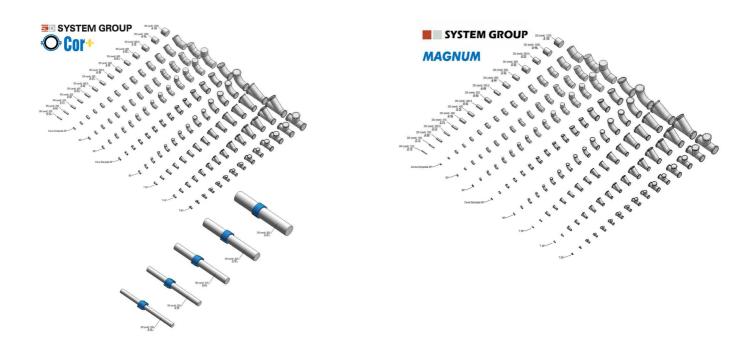

4 - Load the BIM object in Autodesk Revit

The BIM object "SystemGroup_CorPress.rfa", "SystemGroup_Core+_RaccordoT.rfa,

"SystemGroup_Core+_Curva.rfa " , "SystemGroup_Magnu_T.rfa" e

"SystemGroup_Magnum_Curva.rfa" is intended, to be added to the project, as a system <family>. The object is presented in a Revit .rte template file from which it is easy to extract the object in .rfa format as a loadable family. The object is contained in a revit template file .rte from which it is possible to extract the .rfa object.

The typical method for adding a BIM object to the project with the extension .rfa (Revit Family) is as follows:

You can add the object following the instructions below:

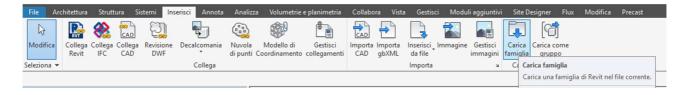

1. select from the command tab the "Insert" botton

Sistemi Inserisci Annota

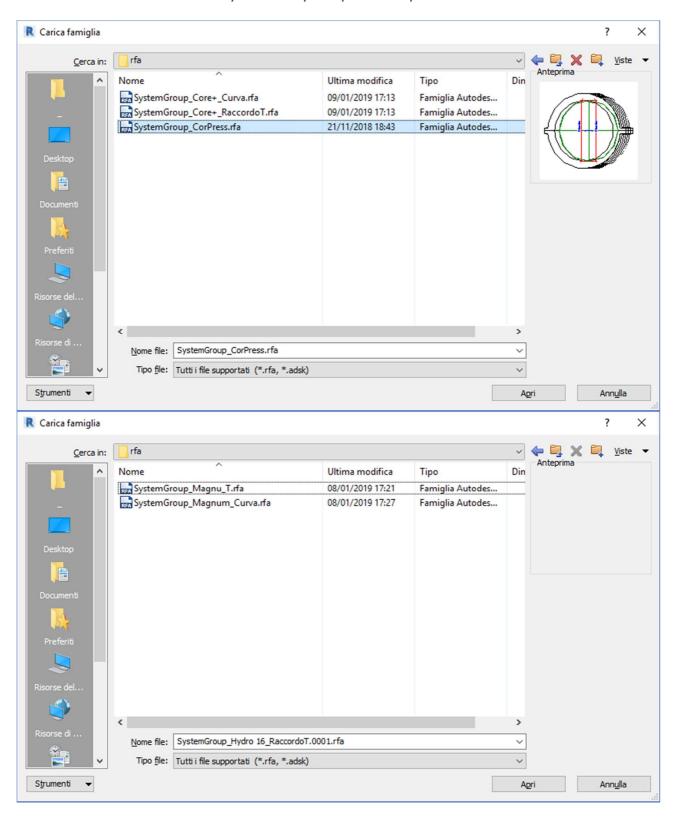

>> "Load

Carica famiglia

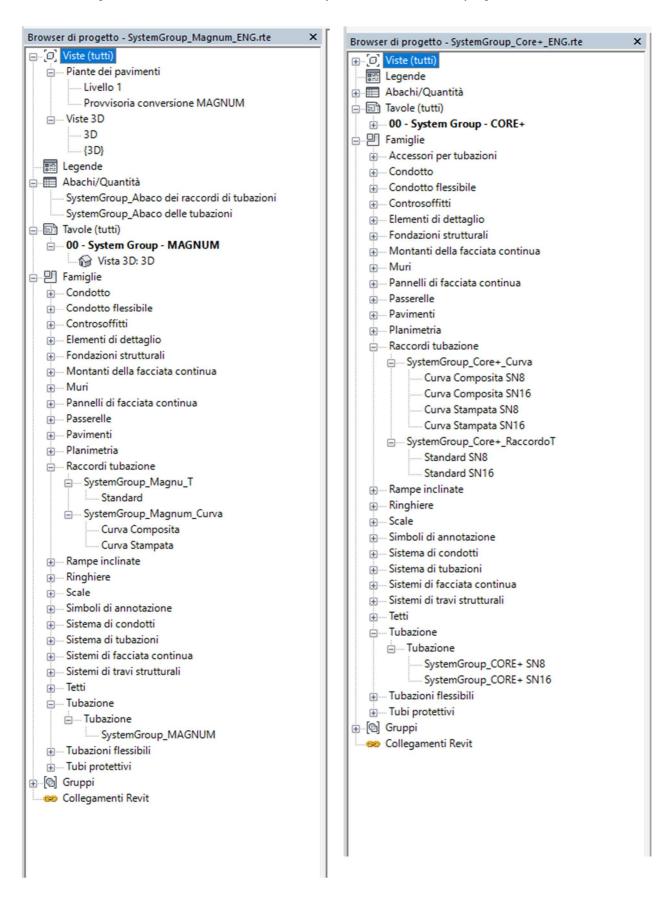

Family"

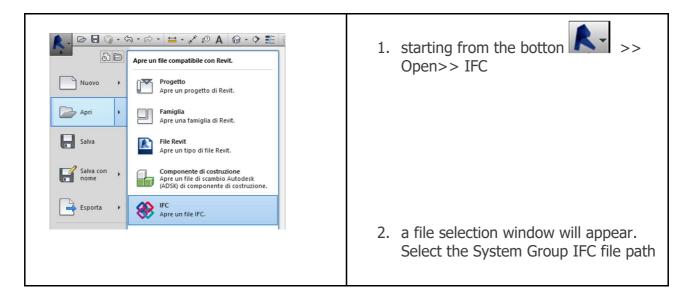

2. select the downloaded SystemGroup file path>> Open

3. the object is now contained in the family list inside the RVT project

You can add a BIM object in an .ifc extension to the project following this method:

3. Select the object and copy it (Ctrl + C from the keyboard or use the Edit tab on the bar and select the copy to Clipboard command).

4. Now, in the target window, paste the Bim object file (Ctrl + V from the keyboard) or use the Edit and Paste command tab.

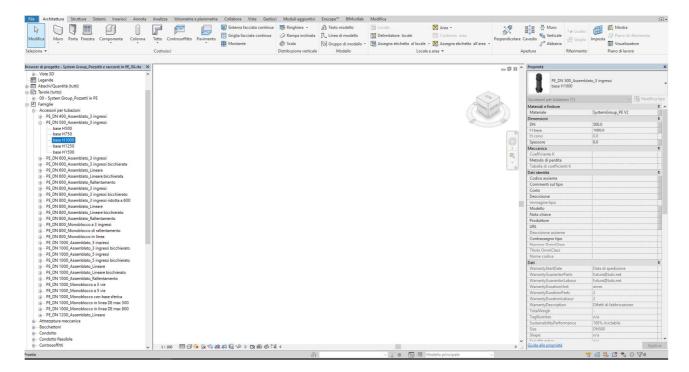

This adds a new family type to the family type list. The Bim object is now available for use in the project file.

5 - Using BIM object "SystemGroup_COR+"

The loaded object in the project is contained in the "Pipe Accessory" category and for this reason it can be combined with pipe elements inside a project.

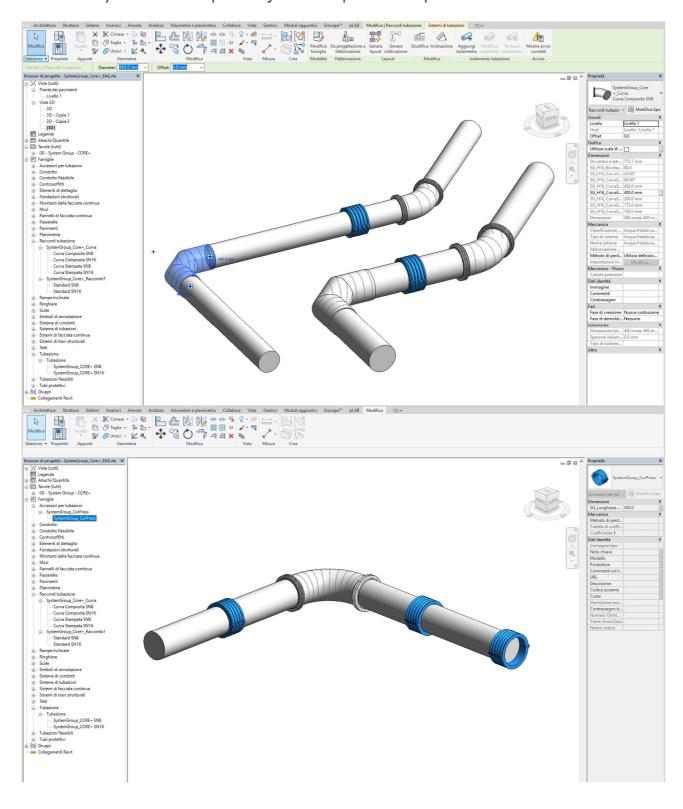

You can insert the object in the project work area by a 3D view or by a plan view. We will show a 3D insert method for a better comprehension.

1. In order to use the object inside the model, you have to select the object in the families list in your project browser on the left of your revit windows and drag it to the work area.

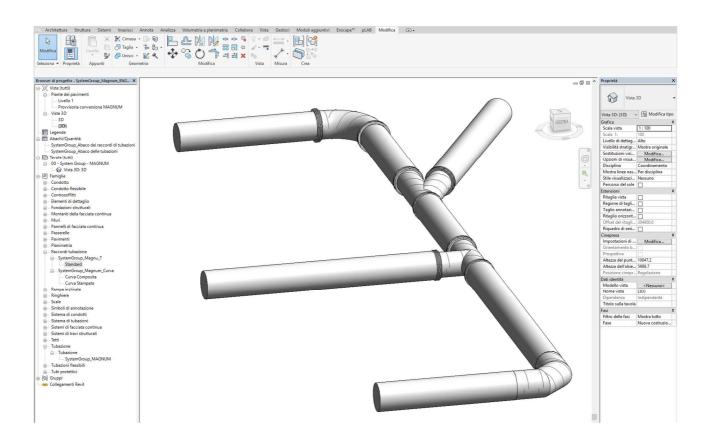

2. At that moment a preview of the object appear on the screen.

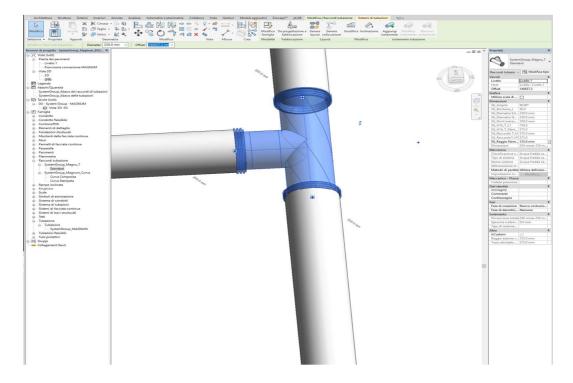

3. Now you have to drop the object to the placement spot desired

4. Once placed the object, you can edit the custom parameters as, for examples, the manhole base type ora top enclosure part by selecting the assigned field on the properties tab.

5. Then, starting from the placed manhole it is possible to create pipe elements in order to create, or connect to, the piping system.

6- Supply conditions

The service is offered by System Group SPA "as is", in good faith in the substantial respect of the rules, and no responsibility can be accepted for any damages deriving from use, losses, lost profits, etc. suffered as a result of use.
